

product evaluation and new product creation and specification

New invention, or looking to modify and enhance a product or system are specialist skills at Oaksmere, for instance, improving humidity controls for fresh foods – resulting in longer shelf life and better hygiene factors.

We devise original ways to advance procurement, delivery and installation of systems, including wide scale integrated monitoring and control systems, for heating, ventilation and air conditioning.

Large manufacturers demand significant runs for products, but Oaksmere can help you when a customised product is needed. We work closely with UK and European manufacturers who will modify products individually and produce small to medium batch solutions. These have included European display cabinets modified to suit the UK market, alarm system design for extreme low temperature, and condensation removal from refrigerated fixtures.

Key Strengths

- Proven humidity control systems
- Developing enhanced procurement policies
- Delivery of whole product maintenance
- Advanced 2D and 3D visualation capability
- Bespoke creation and manufacturer sourcing links
